WHERE PAST AND FUTURE MEET

THE BX PROTOCOL IS A GIANT LEAP FORWARD FOR CANCER TREATMENT AND YET ITS ROOTS REACH DEEP INTO THE PAST

WHAT RESEARCH IS SAYING ABOUT THE BX PROTOCOL

STUDIES PERFORMED AT UTAH STATE UNIVERSITY ARE GIVING NEW INSIGHTS TO THE BX ENERGY CATALYST
Cancer represents both one of the worst plagues of our time and one of the most pointed failures of our medical system as well. The World Health Organization (WHO) estimates that 84 million people will die from cancer over the next ten years. To put it in perspective, that is slightly larger than the population of Germany and just shy of the combined casualties of the first and second world wars. And yet, despite proclamations of progress, America’s “war on cancer” is failing, notwithstanding the best conventional medicine has to offer.

As the death toll continues to rise and every glimmer of hope seems to get snuffed out, many are finding new hope and an opportunity to reclaim their health. The BX Protocol™ is offering people the ability and opportunity to recover their health. Here are thoughts from just a few BX patients:

Sarah, a mother of two young children, was diagnosed when her second child was a newborn.

“The doctors that initially diagnosed me said that it was a death sentence, that there was no hope. That I was going to die. I had a loving family, a husband, a baby girl and I wasn't going to die because they told me I was dying.” She shared her thoughts again later, two years after starting on the BX.

“The doctor was really surprised that the cancer, the tumors are stable and a few of them are starting to show signs of necrosis which is never heard of with the type of cancer that I have.”

Renee, diagnosed with squamous cell cancer recounts where she was at her worst and where she is now. She said,

“I was so sick I couldn't feed myself, I couldn't do anything. It had metastasized to my leg, multiple places. Everything is completely clear. My tumors are completely gone. The one that was 4 by 2.5 inches, completely gone. The smaller ones maybe an inch around, about 4, they're completely gone. The large one on my thigh, probably about 3.5 inches across and round and very tall, completely gone. My squamous cell marker was above 13. It is now below 1 which is the lowest you can get.”

Finally, Ron was 80 years old when he received his diagnosis of stage IV lung cancer.

“I said what's going on with me? He (the doctor) said it could light out any minute. And I said well, what's my odds, what's the possibility of beating this? He was an old pulmonologist and he said, 'I've never seen anyone beat it.' So the doctor recommended us to hospice. So I started hospice two days later. And I'm a member of hospice now.”

Ron made that statement on the first day of treatment with the BX Protocol. One year later he was interviewed again and said,

“Here I am a year later. A year's a long time with my condition of stage 4 lung cancer. And so they told me at Huntsman Cancer clinic I'm now one in a thousand and I'm out of the textbooks. They haven't seen anything like this.”
While these stories may seem incredible they are not entirely rare. The BX is spreading across the world, from the US and Canada to Dubai and China. This breakthrough is part of a paradigm shift that is helping us to see disease in a new way. According to the research performed by the Delta Institute International, the cause of many chronic conditions may lie deeper than previously thought. The root cause of these conditions appears to be a dysfunction in the mitochondria. As Dr. B. McDougal states, “We’ve known, and there’s phenomenal research to support, that cancer is a metabolic disease resulting from altered mitochondrial function.”

Dr. M. Gerber echoes this sentiment. “Going back to Otto Warburg 1905, he said that all cancer cells have disturbed mitochondria so any way we can guide this mitochondria back to full functionality and good health certainly has to be a big boon in our war against cancer.”

Guiding the mitochondria back to full functionality is one of the main functions of the BX Protocol. This approach is vastly different from the one that is taken by mainstream medicine. The current allopathic approach is to focus on managing symptoms and maintaining a current level of health. The BX, however, has a different goal. Dr. Dewayne Smith, the creator of the BX Protocol, has said, “The medical culture is hyper focused on health care. Our protocol is focused on health restoration.”

For many people, the concept of health restoration is new. We have so wholeheartedly accepted that some diseases cannot be cured that the possibility of actually overcoming them is not even considered.

The pharmaceutical industry does a lot of good for a lot of people, however, pharmaceuticals are also one of the leading causes of death in our country. There are also many diseases which could be cured but are only treated because curing them could eat away at profit margins of the big drug companies. While it would not make sense to completely eliminate all drugs, it is important for people to recognize the inherent conflict of interest that the pharmaceutical model has built into its infrastructure.

Dr. S. Tenpenny said of this industry, “For decades we have believed that the pharmaceutical industry is out to find a cure. We have spent billions of dollars over decades, ostensibly to find a cure, but the pharmaceutical industry is never going to find a cure.”

Dr. R. Rowan said, “The paradigm today is to kill the symptom. Give it a chemical. And it’s the greatest Ponzi scheme the world’s ever known because if you suppress a symptom with one chemical you will get two or three more symptoms that have to be suppressed with yet more chemicals, and so on. So you see, just follow the money trail to know why we’re in the system we’re in today.”

Many people talk about this idea as though it’s some hidden dark mystery, but all the information needed to understand this is in the open. Dr. D. Smith said of this, “It’s not like the pharmaceutical industry is out to get you. This is not a conspiracy. The fact is that they rely on longevity of treatment to sustain their profit model and at a cost of $800,000,000 to bring a drug to market, I guarantee you they can’t afford a cure. It would put them out of business.”

The numbers speak to the frightening realities surrounding this grim statement. Dr. T. Dumaurier furthered this point, “22% of the gross national product comes from pharmaceuticals. All that money comes from drugs that treat symptoms. Your pharmaceutical industry isn’t going to save you. The money isn’t in health. The money is in sickness.”
While these realities are heavy and can cause some people to despair, there is still hope. Dr. Smith said, “The irony of it is that the pharmaceutical industry has created a window of opportunity for Delta’s health restoration model. People want meaningful results. People are sick and tired of being sick and tired.”

Delta describes the BX protocol as the rebirth of former discoveries combined with modern delivery capabilities. Delta’s technologies division has developed many health restoration technologies that have taken cancer treatment into the future. The BX Energy Catalyst and the new technologies created by the Delta institute are not another fad-driven treatment.

Dr. Smith states, “The BX protocol is literally a new paradigm in medicine. It’s unlike anything you’ve seen before. It’s not pharmaceutical, it’s not nutraceutical, it’s not homeopathy, and in many ways, it challenges the conventional wisdom. And that’s part of the reason why it’s working.”

So what exactly is the difference between the BX and more traditional treatments? Unlike conventional treatments, the BX produces its effects by correcting the dysfunctional machinery within the cell. This is in contrast to mainstream treatments which rely on crude cytotoxic effects that damage both diseased and normal cells. The BX actually improves cellular performance within the general cellular landscape.

According to a study conducted at Utah State University, non-small cell carcinoma cell lines were profoundly impacted by BX within the first 90 days of the study. Dr. Patti Champine M.Sc. who conducted the study shared some of her thoughts on what she was seeing during the study.

“We’re starting to really, by 90 days, see a diminishment of growth capacity and the number of cells remaining when we treat with BX in this case. It’s definitely having a very strong impact, and not on the normal cells, just on the non-small cell carcinoma cells.

And it’s interesting because I don’t see overwhelming toxicity. I don’t see the cells just sloughing off in big numbers. But they slowly start growing slower and less energetically and less prolifically so that we have a reduction in the cell numbers without seeing a lot of cells coming off and floating around and being dead within the media releasing lots of toxicity.

I’ve worked with toxic chemicals and what you see is just this morass of dead floating cells and there’s nothing adherent anymore when you treat with a toxin. And I don’t see that effect here. It’s clearly a very different mechanism. It’s going to be far easier for the body to tolerate. It’s going to be far easier for the cells to take in and deal with. I just see so much potential for this because it is so different. I think it’s fascinating. It’s not like anything else I’ve worked with.”

These results are exciting, but not surprising to the Delta Institute. Results of this kind had been previously taking place in a study done in China.

One oncologist in mainland China performed pre and post treatment biopsies on four breast cancer patients using BX. After 120 days all four cases demonstrated a change in the tissue from malignant to benign status. This was confirmed through pathological examination coinciding with the university study regarding the corrective nature of the BX Energy Catalyst.

The results were so impressive that the Chinese academy of Sciences in early 2015 initiated efforts to implement clinical trials and approve the BX for widespread use in mainland China. Similar efforts are underway in several countries.

This incredible treatment is changing lives and reversing conditions that were once thought to be irreversible. Dr. Smith says, “The BX is showing unprecedented results in about 41 different areas. You take that, you combine it with the other proprietary technologies that we’ve developed and you have the potential for a revolution in healthcare around the world. Our home program combined with our health restoration resort model is the future of medicine. It’s a vital paradigm shift from healthcare failure to successful health restoration.”

The Delta Institute International continues to pursue successful health restoration for its members and is looking forward to an exciting future.
By B. Randall

Cancer research seems to be a new field, as though cancer just appeared out of nowhere. The reality is that cancer research in some form or another goes back generations. In the 1970’s, however, America began its “War on Cancer”, which many feel is the beginning of modern cancer research.

Many are unaware that meaningful research on how to treat or prevent cancer occurred before the 1970’s. The irony behind this is that at a banquet in 1931 a man named Royal Rife was being honored for his research. The banquet was a celebration of the end of disease. Rife’s work was compelling and proven to be effective by University studies and yet bringing up his name in the halls of academia today will bring nothing but blank expressions at best and derisive laughter and damaged credibility at worst.

Cancer research, in the modern sense, has actually regressed by at least a century. As incredible as it may seem, some of the most important discoveries made in this field may have come about in those earlier days. The BX Energy Catalyst™ is a treatment that has implemented some of the discoveries of those early researchers. It combines ideas from several brilliant minds of the past with current research methods and more modern ideas of anatomy, physiology, and understanding of cellular structures.

While many people have influenced the research behind the BX Protocol™ there are three prominent figures who were especially important, Royal Rife, William Koch, and Georges Lakhovsky. Although these three men worked independent of each other, their research all pointed to common elements in disease causation and treatment. The majority of their work took place between 1920 and 1940.

Dr. Smith, the creator of the BX Energy Catalyst, has spoken often about the importance of their work. “The period between 1920 and 1940 was sort of a medical renaissance.”
You had a handful of scientists that had collectively cracked the code behind the root cause of most of the major diseases. At the time, they didn’t comprehend exactly what it was they had discovered. Today we know it as mitochondrial dysfunction.

Koch, Rife, and Lakhovsky understood this principle even if they didn’t have the terminology to describe it. Mitochondria had not yet been discovered by the mainstream medical community. While most of their contemporaries had little appreciation for their work, they did attract the attention of some. Dr. Willard Dow, head of the Dow chemical company estimated that the work of William Koch, for instance, was at least 100 years ahead of his profession. He went on to say that the medical community of their time was simply not capable of comprehending the significance of Koch’s work.

Meanwhile less than 2000 miles away, the University of Southern California had just concluded a clinical trial of Royal Rife’s radio frequency treatments. This trial demonstrated an astonishing 86.5% cure rate in late stage cancers. This was only the tip of the iceberg of what Rife’s machines could do.

Near the end of this era, Georges Lakhovsky appeared on the scene in Europe. His machines began to spread, first in France and then across Europe. As his work started to gain traction there were doctors in the US who began to use his machines as well.

It would be easy to assume that these men treated a handful of people and their work went largely unnoticed. This is far from the truth. Dr. Smith said of this:

“These men were responsible for collectively curing about one million cases of cancer during this period. You had 4000 doctors in North America using the protocols. You had 2000-3000 doctors in Europe using the protocols. The face of history could have forever been changed, but anytime you have revolutionary discoveries you have opposition knocking at the door.”

William Koch was harassed by the government and various other groups and agencies for nearly a decade. He was taken to trial and the Supreme Court of Massachusetts referred to the treatment of Koch as a “moral crime of the very worst kind.” Witnesses were browbeaten by lawyers who attempted to make them turn on Koch.

In spite of everything that was working against him, Koch was not found guilty. Unfortunately, this did not end his persecutions. After years of being antagonized, he fled the country, never to return.

Rife also became a victim of the courts. The leadership of the AMA funded lawsuit after lawsuit against him. These lawsuits did not target his machines, as there was compelling evidence that they were effective, but rather they targeted his business practices. This endless string of lawsuits ended his work and he died penniless.

The case of Georges Lakhovsky’s death is perhaps the most interesting and leaves the most lingering questions.
Over the course of a long career in Europe, he had received little negative attention, but he died while conducting trials in New York City. He was killed by a hit and run driver whose identity was never discovered. Upon his death, all his machines were confiscated and patients were told his treatments were no longer available.

All remaining equipment from any of these treatments was confiscated by the FDA, and labs caught fire under mysterious circumstances. Shortly after their deaths, their work was forgotten. For almost 40 years much of this research laid in obscurity, but in the summer of 1991, Dr. Dewayne Smith made an amazing discovery. He recounts his experience often. “During my early 20’s I became completely obsessed with the study of old texts, particularly the history of science. If you knew of a place that had old dusty books that’s where I’d be. During the summer of 1991, I was rummaging through the shelves of books at a used bookstore and I ran across a book that impacted me in a most unusual manner. You could call it metaphysical, you could call it spiritual, whatever. But it was unlike anything I’d ever experienced.”

He picked up the book and read the title, “Cancer and Its Allied Diseases”. This was one of the texts authored by William Koch in 1929 and it provided the impetus that would shape every aspect of Dr. Smith’s work for the next two decades. After learning about Koch he learned about Rife, Lakhovsky, and more. “What I began to realize was that most of the major scientific contributions over the past 100 years were made by people that I had never heard of: Georges Lakhovsky, Royal Rife, Virginia Livingston-Wheeler. There were many others that were doing absolutely amazing things, and their work could have resolved most of the medical dilemmas that face our world today.”

The work of these scientists and researchers, forgotten for so many years, has come back into the light and is showing the world a new paradigm in health and healing. The BX Protocol is changing lives in 22 countries, and resolving dozens of conditions that were said to be incurable. It is providing new hope to a world that has been failed by the western medical model. The BX is the product of powerful new research techniques and practices but it is also a continuation of the work of many unsung heroes from our past.
